John Deere Part - the better part!

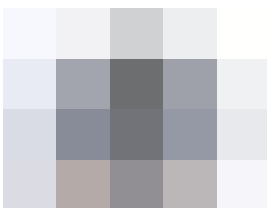

Genuine John Deere Filter and fake - of the same quality standard? See the difference!

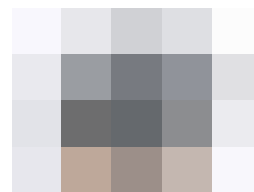

A seal guarantees a reliable filtration at the John Deere filter.

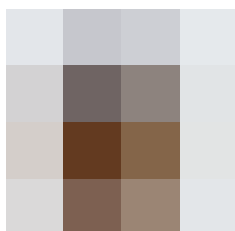

The fake has no seal to prevent the blending of dirty and filtered oil.

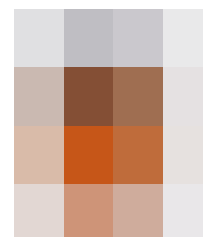

The genuine part incorporates a spring giving correct spring pressure and and superior filtration.

Lower spring pressure little spring displacement and an unspecific figuration of the spring provoke a inferior filtration.

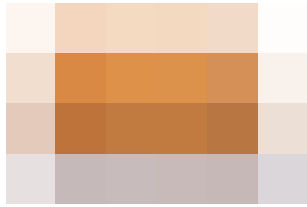

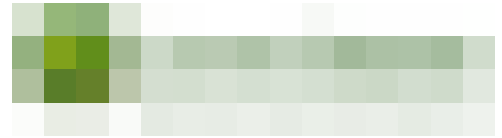

High quality filter paper has a higher density which lets no light through - as the John Deere quality standard requires!

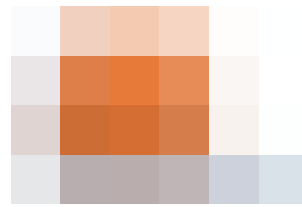

Inferior filter paper is more permeable to particles which can easily be proven by a light test.

John Deere Part - the better part!

If you press the paper you see that John Deere uses premium paper. In pressed condition it is 50% longer than the fake. This results in a stronger paper that is crimped to support an equal filtration and a larger surface.

The paper of the fake is not crimped so that folds can pool together. The subsequent filtration will be very unequal.

Don't endanger the reliability and productivity of your tractor with a „fake“ through:

- Brummagem paper
 - Stiff paper
 - Non-specific spring
 - No sealing
- ⇒ Less efficient filtration has bad impact on the reliability and lifetime of your material!

Therefore benefit from the quality advantages of the „Genuine Part“:

- + Dense paper
- + Crimped soft paper
- + Special spring
- + Effective head sealing

**Decide on the Genuine JOHN DEERE quality standards -
Contact your JOHN DEERE Dealer!**
